

Think of the hospital: **Role 3 is the front desk.** **Role 4 is the locked records room.** Staff never walk into the records room themselves. Everything goes through the front desk.

Role 3 — The front desk

Mozzam Shahid

- **Checks the badge.** Is this person allowed to send or review this case? The computer does not trust a name typed on a form.
- **Checks the paperwork.** Is the draft complete and in the agreed shape? If not, it is sent back with a plain reason.
- **Keeps everyone in sync.** When a new draft arrives, the staff screen updates live. Staff do not need to refresh.
- **Hands work to records.** Looks up a patient, and later files an approved case — but Role 3 never stores the final record itself.

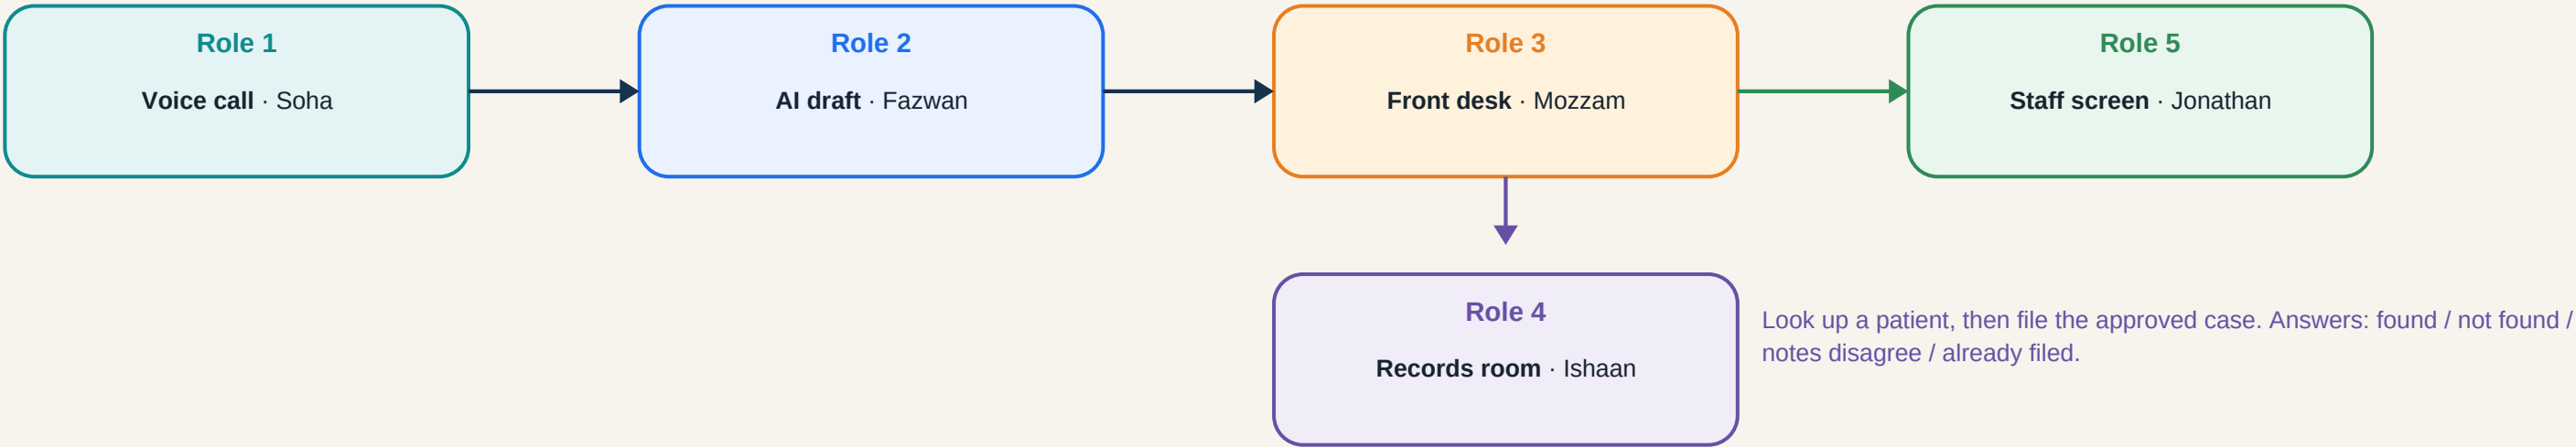

Role 4 — The records room

Ishaan Sama

- **Looks up the patient.** Have we seen this person before? Answers: found, not found, or the notes disagree.
- **Files the approved case once.** Only after a clinician approves. A second click with the same request does not create a second file.
- **Keeps a locked diary.** Who changed what, and when. That diary cannot be quietly edited or deleted.
- **Protects private details.** Sensitive words are locked. Dispatchers see less than clinicians. Old keys can be destroyed after the keep period.

Who talks to whom

The staff screen never writes to the records room. The AI never writes there either. Only the front desk is allowed in.

Three things everyone should remember

The computer does not decide.

The AI draft is a helper. A qualified human still checks, corrects, and approves. There is no automatic diagnosis or final triage.

One door into the records.

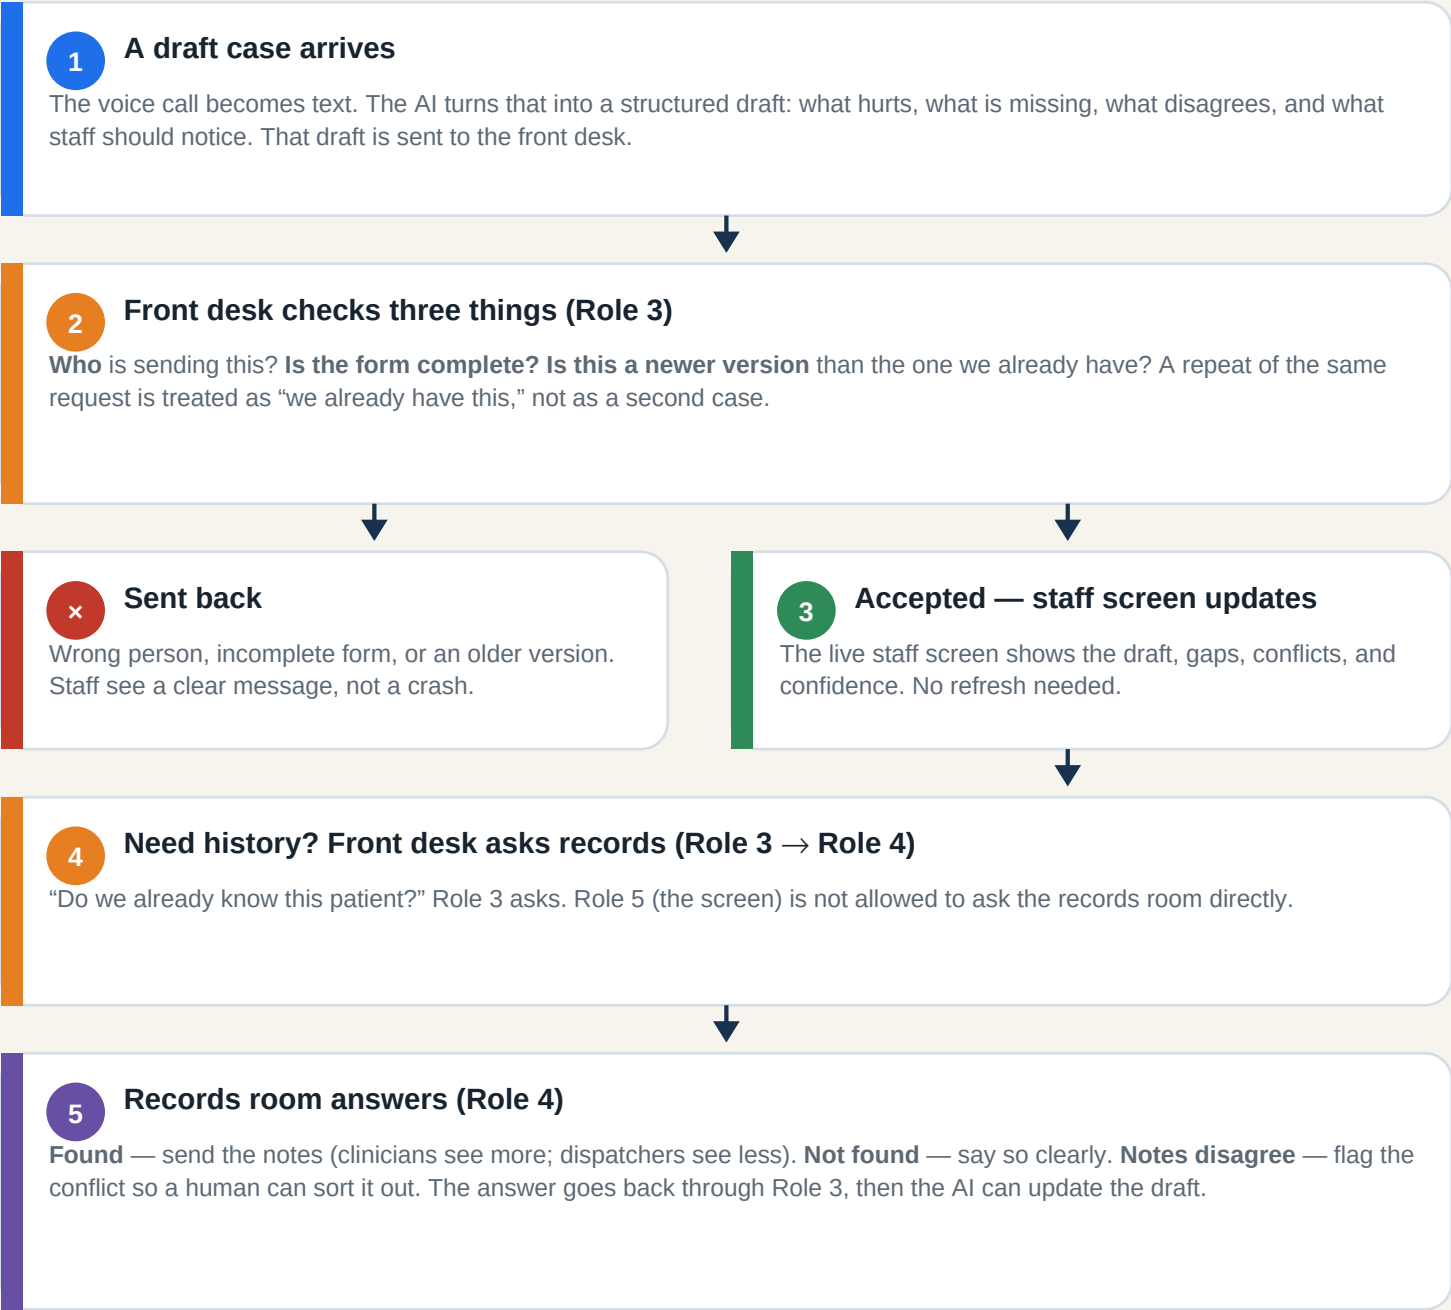

The staff screen and the AI never write to the database. Role 3 checks the person, then Role 4 files the record.

Practice data only for now.

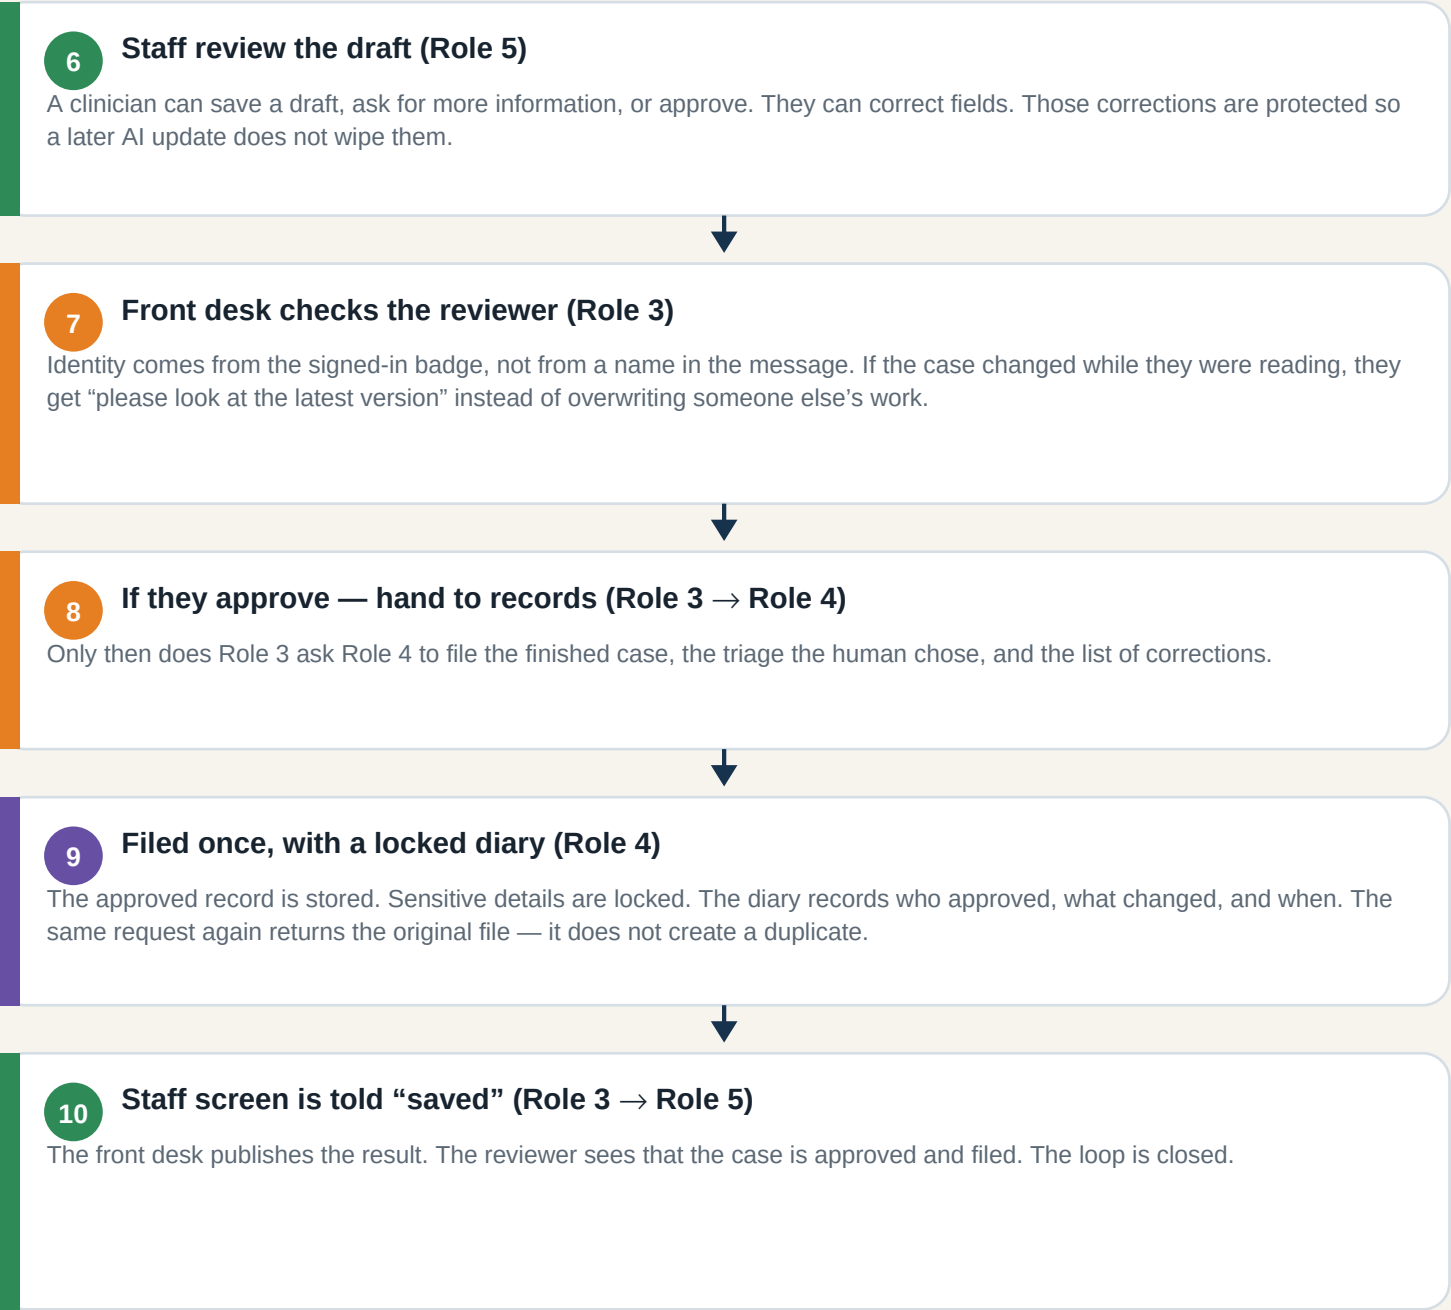

Names look like TEST-PATIENT. Notes start with SYN:. Real patient details, recordings, and passwords stay out of GitHub.

Follow the numbered steps. Orange boxes are the front desk (Role 3). Purple boxes are the records room (Role 4). Green is the staff member.

Getting the case in

Human review and filing

If you remember only one picture

Call → AI draft → **Role 3 checks it and shows it live** → staff review → **Role 3 checks the reviewer** → **Role 4 files it once and writes the diary** → staff see “saved”. Role 3 is the door. Role 4 is the vault. A human still makes the final call.
